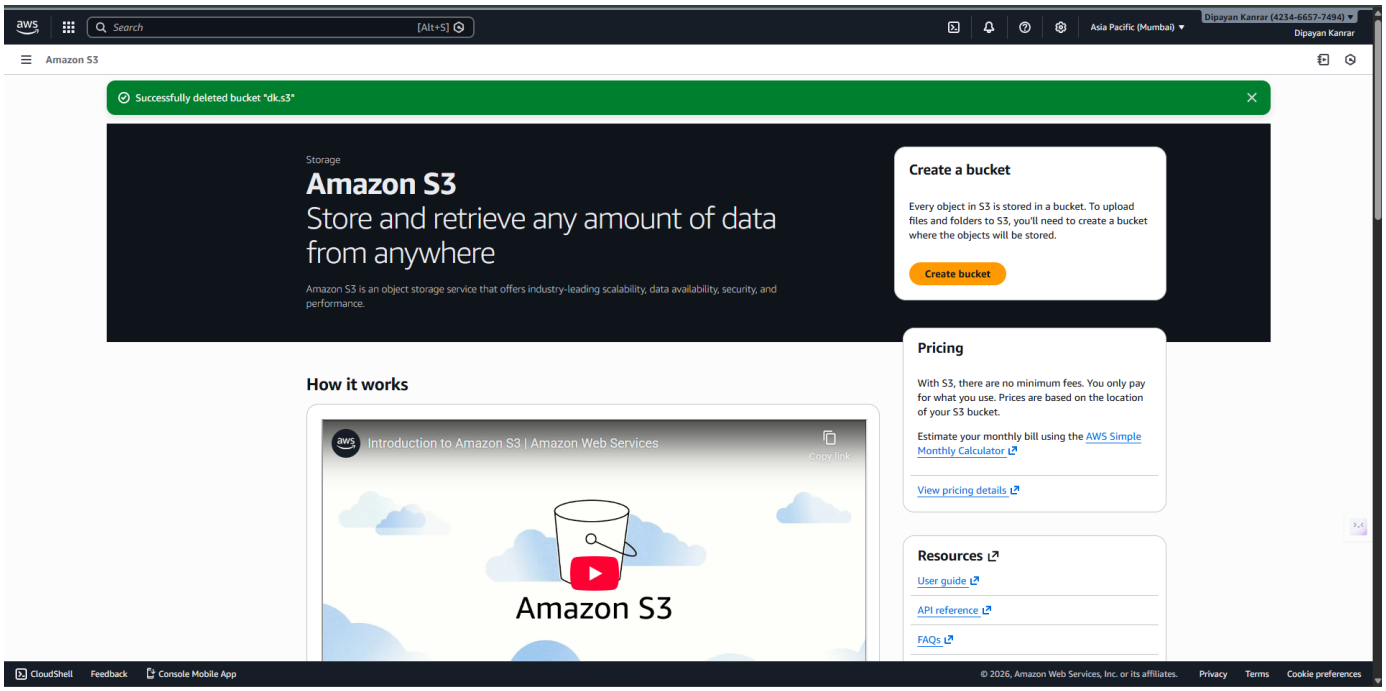
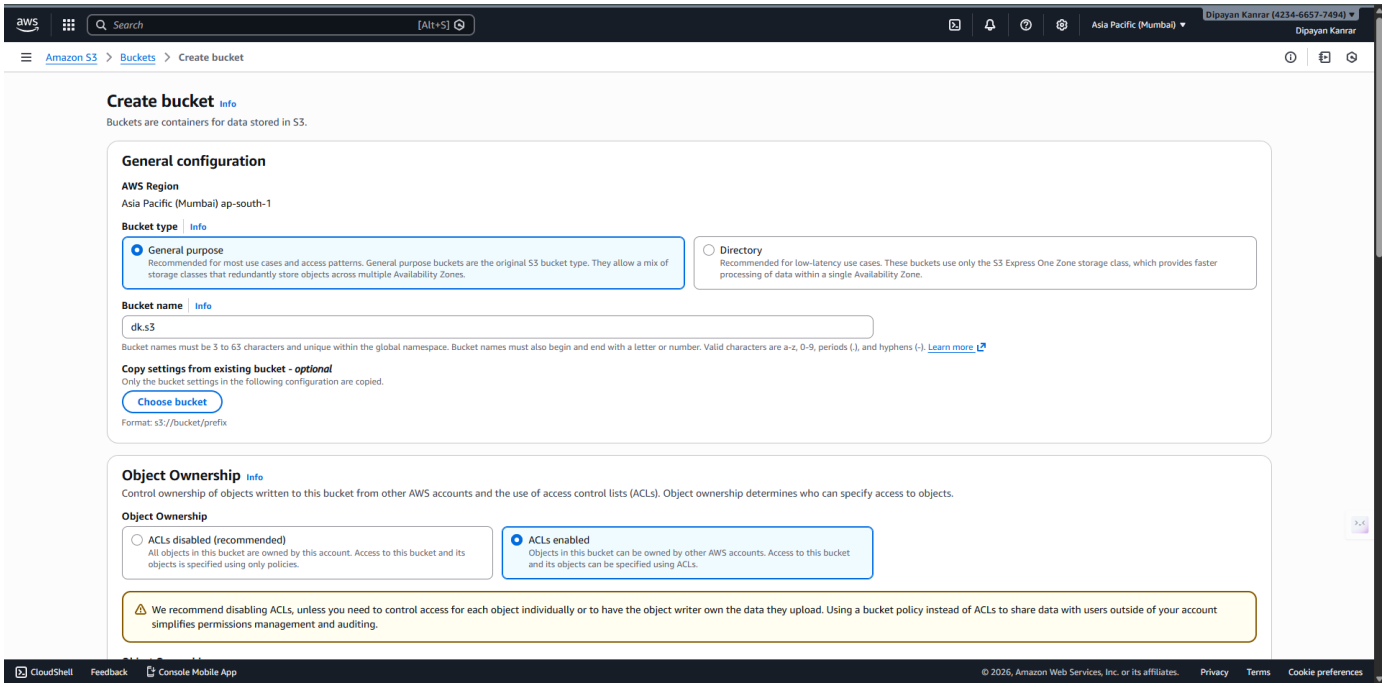
<u>Assignment 5:</u> Create a public Bucket in AWS. Upload a file and give the necessary permission to check whether file the URL is working.

The steps are as follows: -

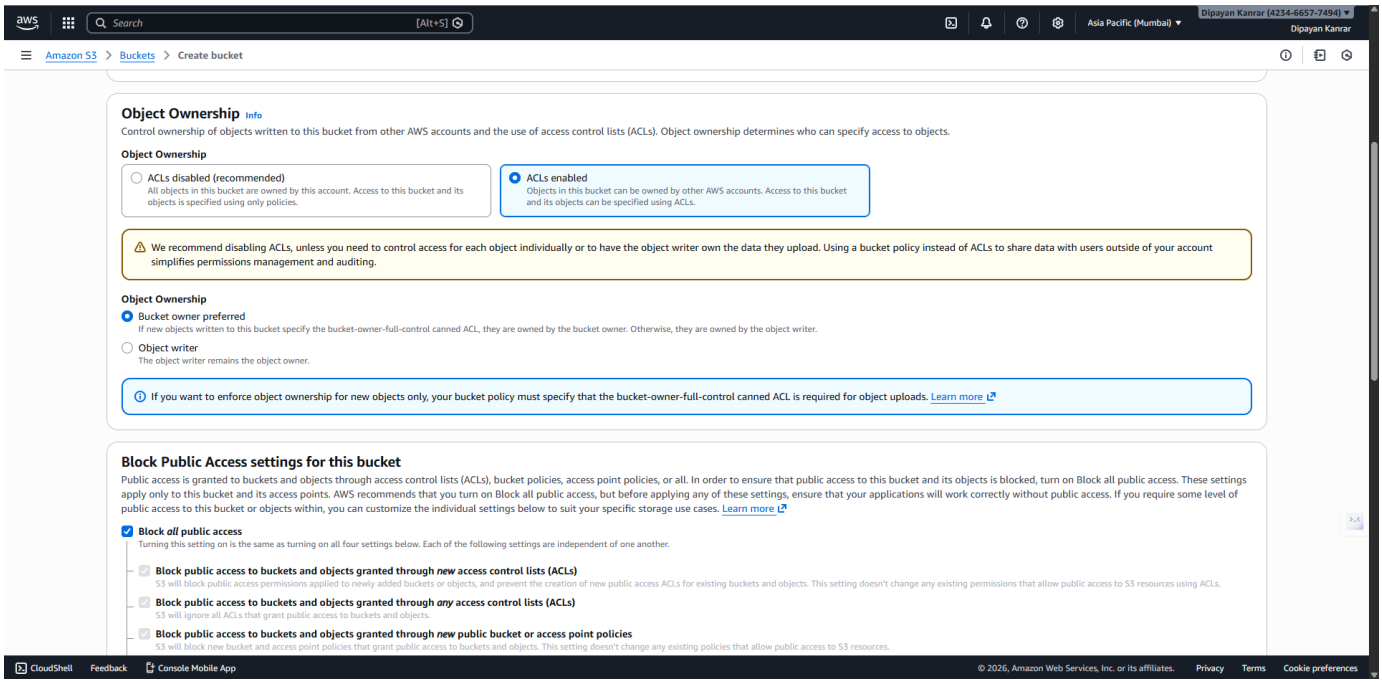
1.Access the AWS console, search for S3, and select the top option from the search results. Click on 'Create bucket'.



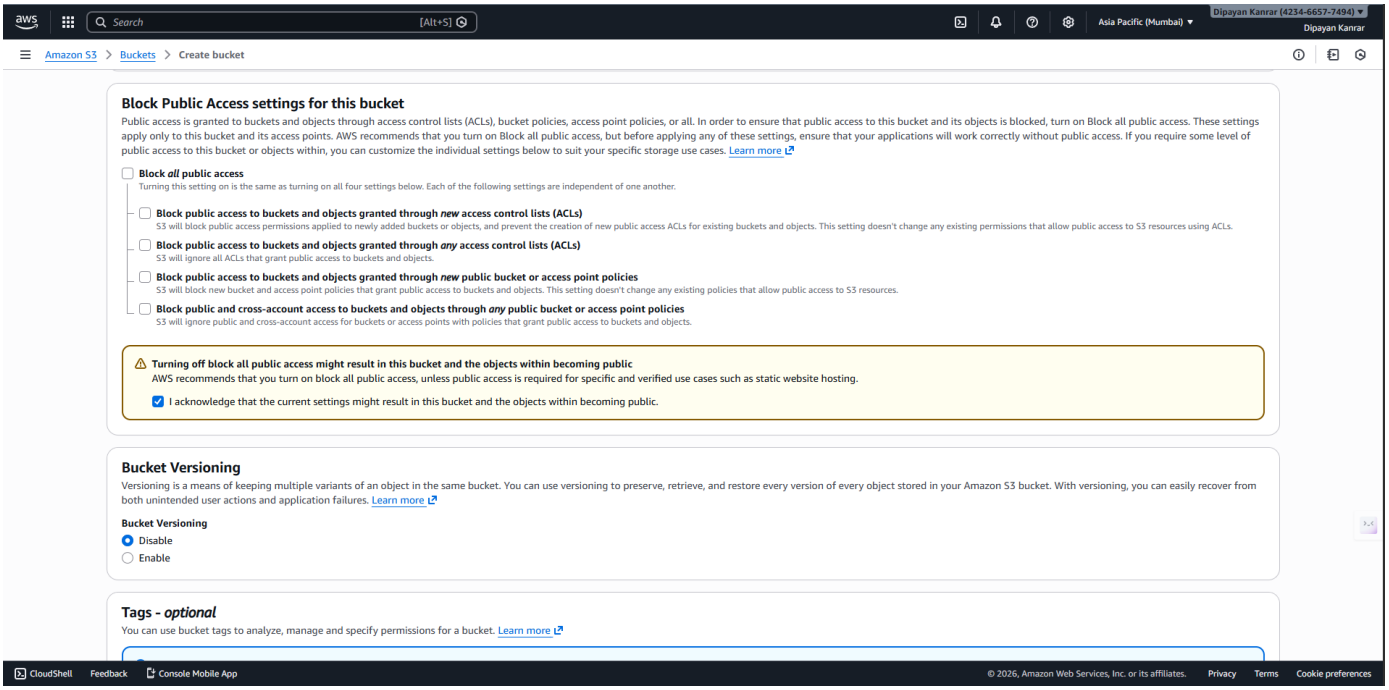
2. Subsequent window appears. Next, specify a bucket name, such as 'dk.s3'.



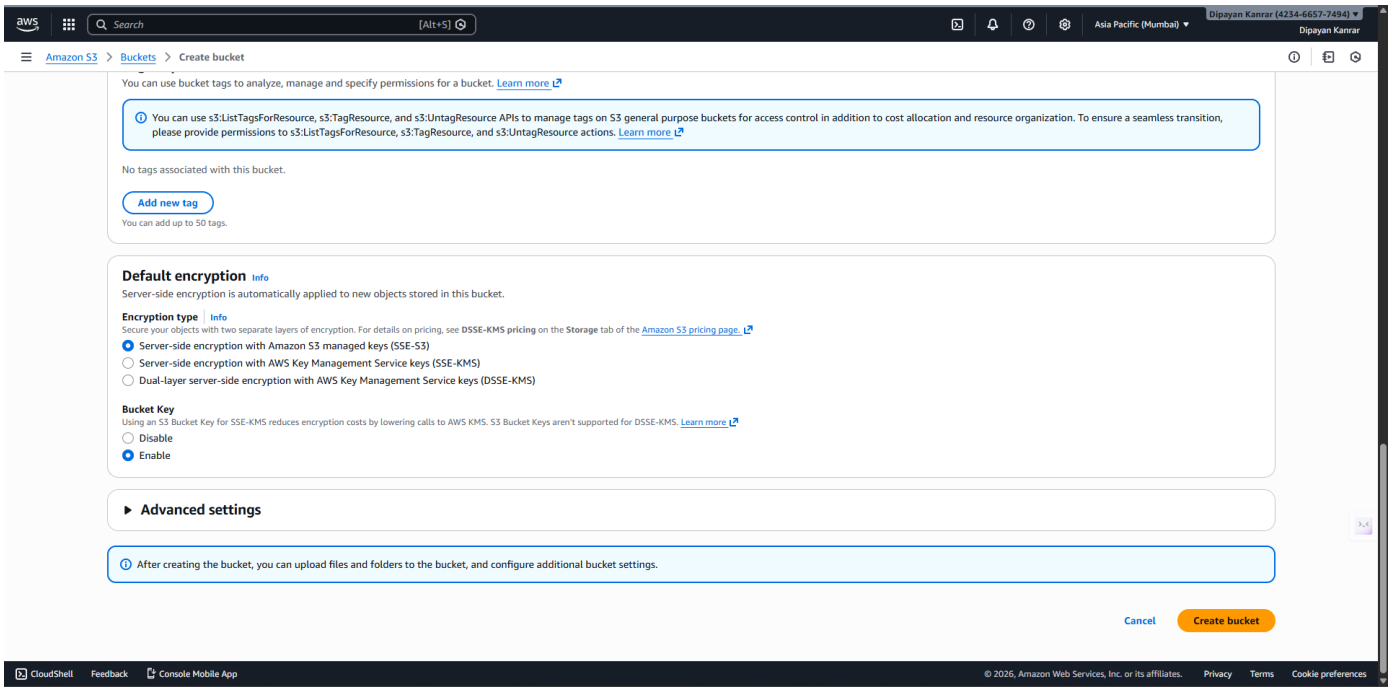
3. By default, the Object Ownership is set to 'ACLs disabled' in this window. Select 'ACLs enabled'



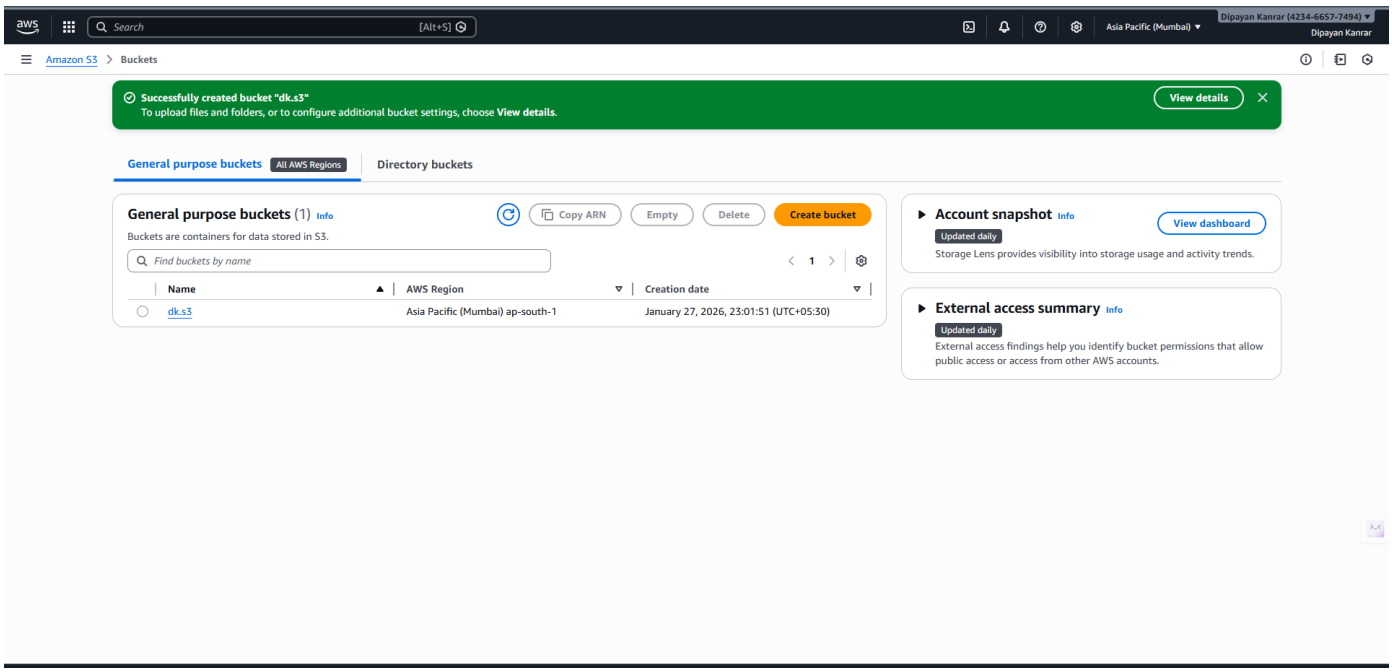
4. Now, uncheck the box for 'block all public access'. At the bottom of the window, check the box confirming that the current setting changes may result in a public



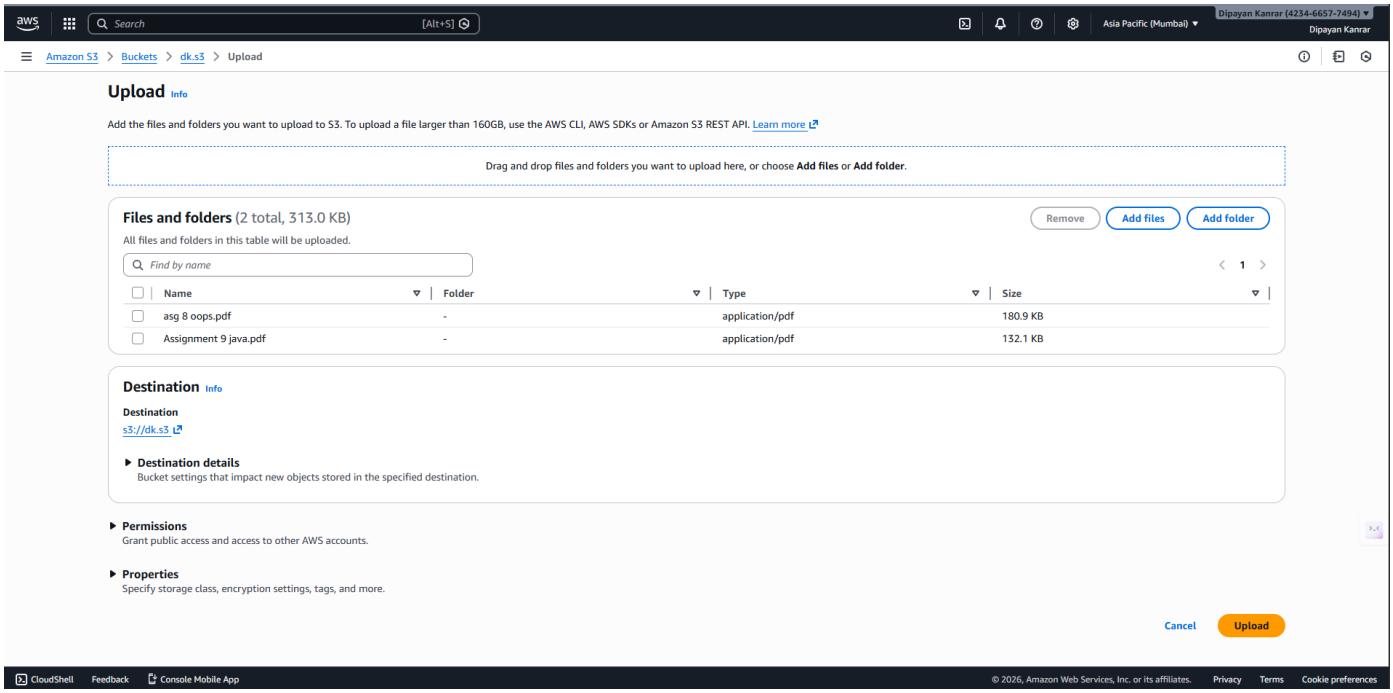
5. Scroll down without any further modifications and proceed to click on 'Create Bucket'.



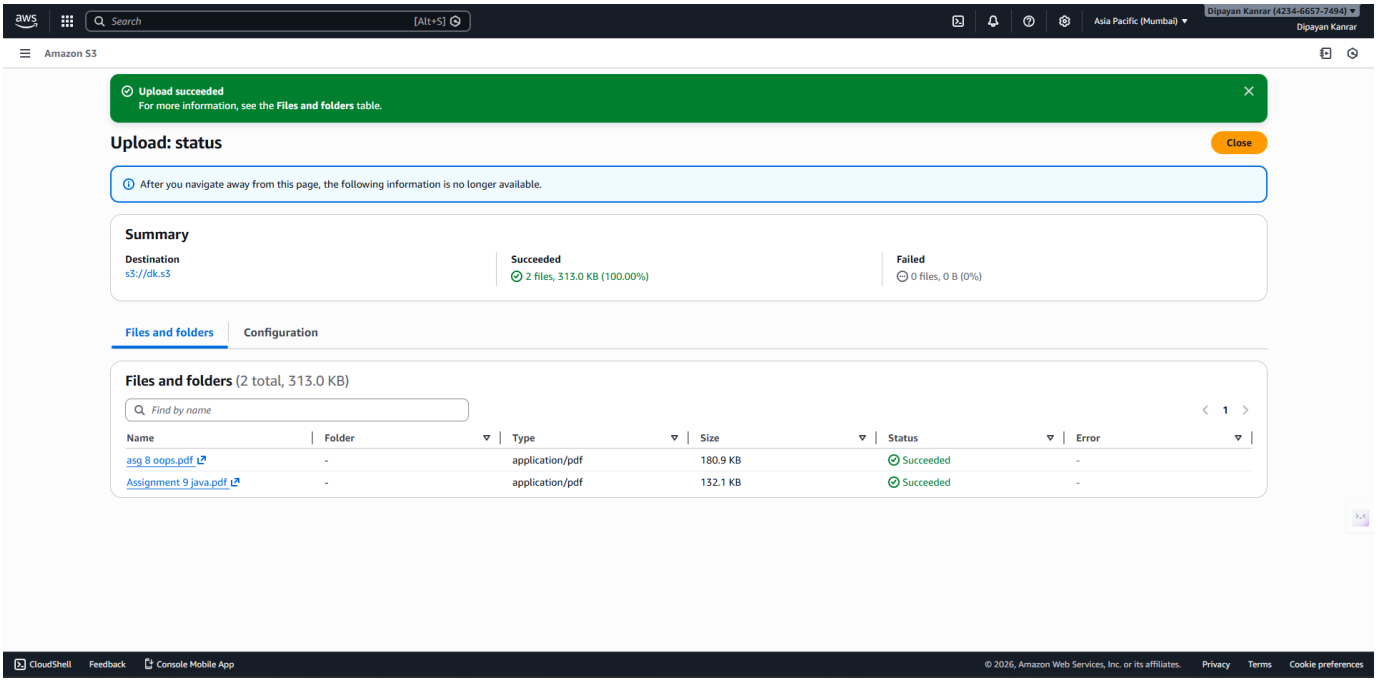
6. It's evident that the bucket has been successfully created



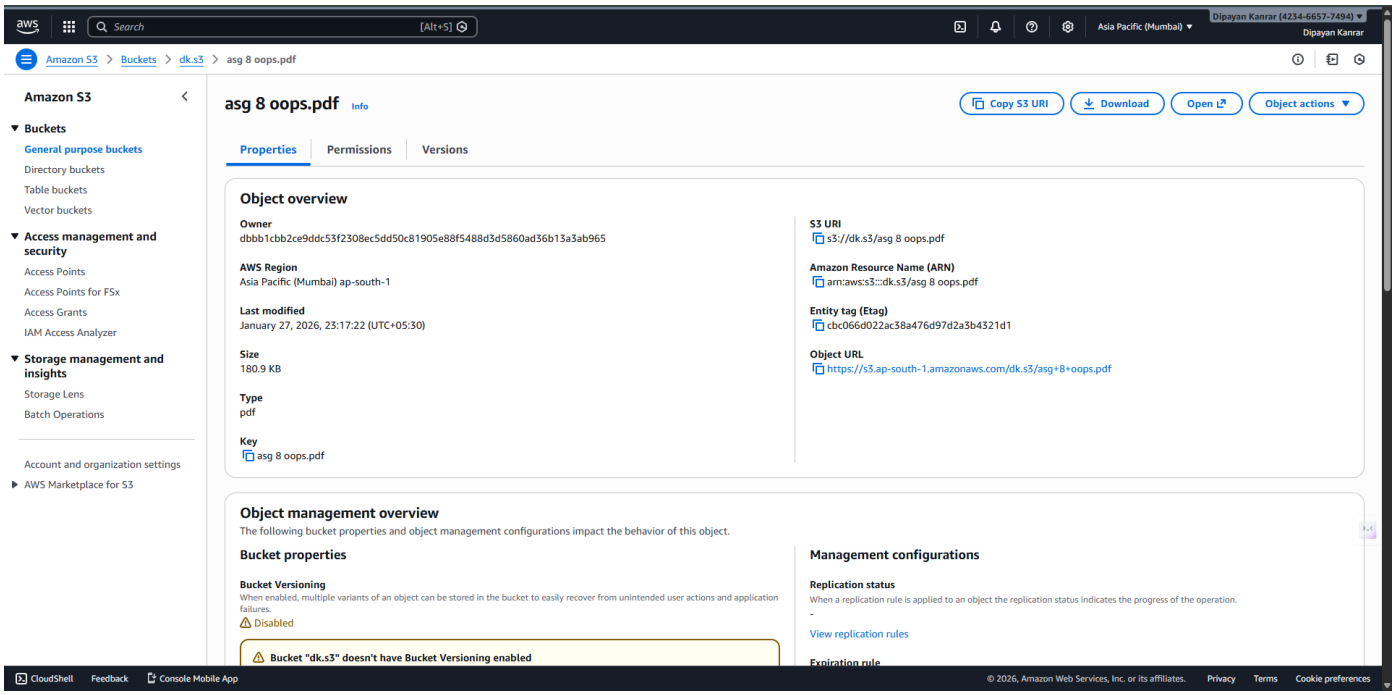
7. Now click on the bucket name. Choose the 'Upload' option, which will lead to the opening of the subsequent window. From there, click on 'Add files' and proceed to upload your desired file(s) into the selected bucket.



8. Scroll down and proceed to click on 'Upload'. The notification confirms that the file has been successfully uploaded.

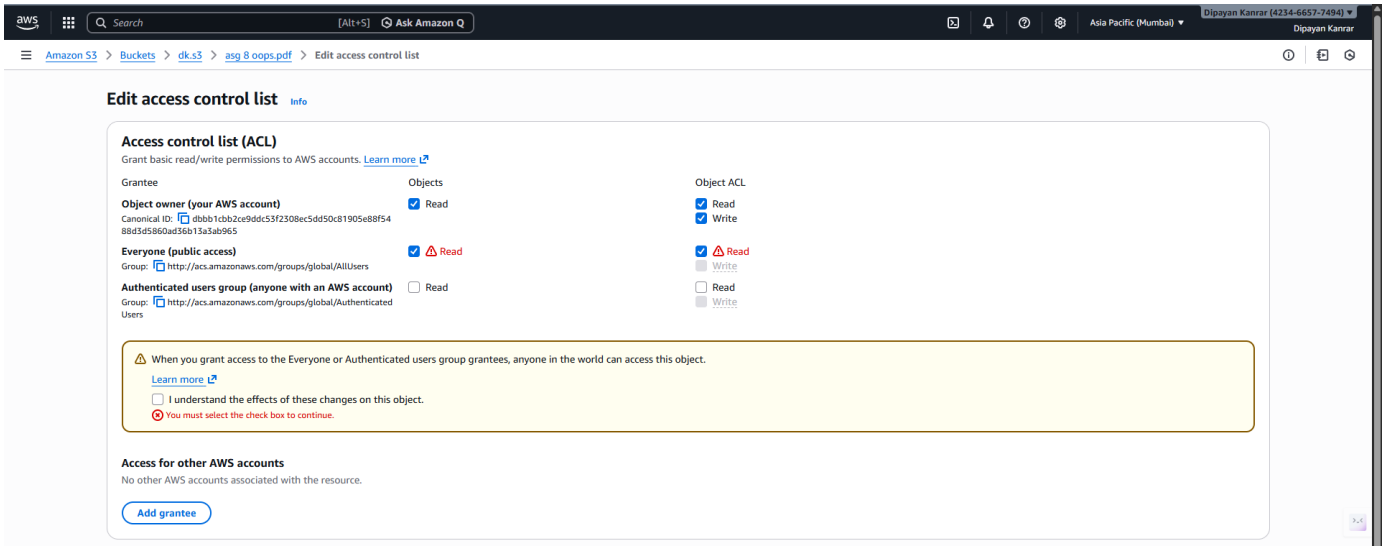


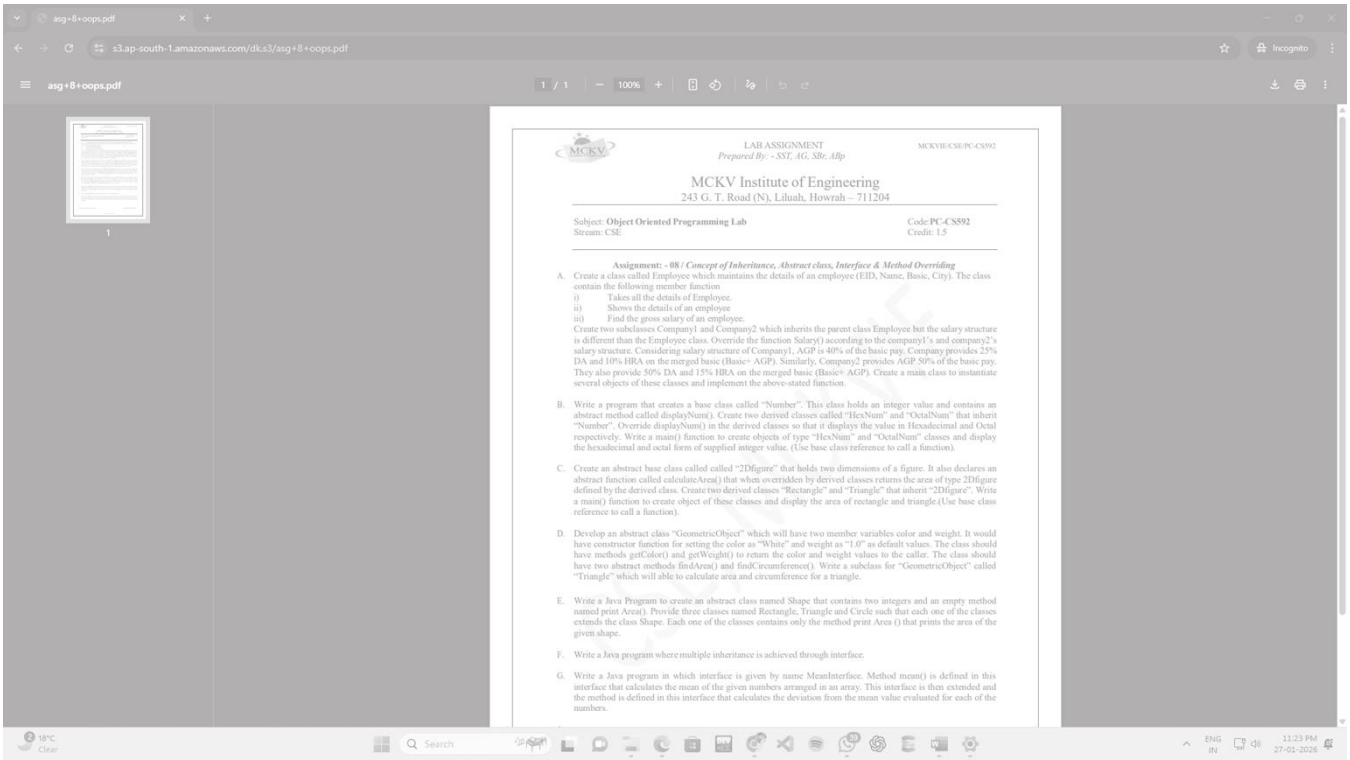
9. Now, click on one of the uploaded files, then 'Copy URL'



10. Navigate on a new window and paste this URL. An error appears indicating that access to the

11. Now, for the same file go to permissions.and Edit the permissions as follows





12. Save the changes made above and once-again copy the URL and search it on a new window only to see it open this time
